# Online Appendix for "Tax Farming Redux" 

Abstract
The online appendix contains additional information about treatment implementation and a series of robustness checks to our main tables. Tables are organized by category of robustness check. For additional results, we continue table numbering from the main text. For those tables that are variations of tables from the main text, we maintain the same table number, followed by a letter indicating the category of the robustness check.

# Additional Information about Treatment Implementation 

## A Knowledge and Credibility of Schemes

In order to ensure that collectors understood the specifics of the scheme they were in, we carried out detailed trainings for each scheme at the start of the the year, post-training quizzes and refresher trainings. By seven months after treatments started, quiz results revealed that virtually all inspectors were able to understand the scheme and accurately calculate the payments to which they would be entitled.

A total of five training sessions for circle staff were conducted over the treatment period; three in the first year (August, February, May 11-12) and two in the second (August, October, 12-13). Trainings were conducted after each randomization lottery, and retraining sessions were conducted after an interval of 2-4 months, covering all treatment staff. The training for each subtreatment was conducted separately to avoid any confusion between them. During the training session, treatment staff was given detailed description of each subtreatment, the variables on which their performance would be judged and the formula for calculating individual payments. Circle staff worked through examples calculating their earnings under different scenarios and the sessions concluded with a question and answer session.

To judge circle staff's understanding of the treatments, they were quizzed six times at regular intervals over two years. The quiz tested staff on knowledge of the subtreatment they were selected in, the criteria they would be judged on, the formula for calculating their payments and ability to calculate their own payments under different scenarios. The initial understanding of the treatments was low, with around $37 \%$ inspectors failing the quiz conducted after the first training, but this improved substantially after multiple trainings, and within 7 months after randomization, failure rates dropped to under $1 \%$ and remained under $10 \%$ for the remainder of the treatment period. The quiz results show that shortly into the project, staff had a good understanding of their respective subtreatments, how their payments would be calculated, and what they needed to do to increase their payments.

Finally, to check that inspectors in fact knew what schemes they were in, towards the end of the second year (in July) all inspectors (including those not in treatments) were called in a brief phone survey. As part of this, they were asked whether they were participating in one of the circle-level incentives schemes, and if so, which one. Appendix Table A. 3 reports the result of a dummy for being in each of the 4 inspector-level schemes (Revenue, Revenue Plus, Flexible Bonus, or Information) on actual participation (instrumented with the results of the randomization). As is evident from the table, inspectors clearly knew both which scheme they were in and were able to accurately differentiate between the schemes, with the only mistake being that a small number of inspectors from the Revenue scheme mistakenly reported being in the Revenue Plus scheme.

Since performance-based pay had never been introduced in the tax (or, for that matter, any other) Punjab department before, another important aspect was ensuring credibility of the schemes - i.e. that inspectors believed they would be paid as promised. This was partly helped by the successful completion of a pilot project with 11 tax circles selected for incentive schemes in the year
preceding the project. We also ensured that at each stage of the process, formal approvals were received from all relevant government departments, including the Chief Minister (the equivalent of the provincial governor), the Tax department, the Finance department, and the Planning and Development department, and that these approvals were communicated to all parties concerned. Finally, the payment process was designed to further establish credibility. Although the final payments each year were determined only based on end-of-year totals, staff were paid each quarter based on their cumulative earnings under the scheme through that quarter, with corresponding quarterly benchmarks computed in the same way as the final annual benchmark. ${ }^{51}$ Payments were carried out separately in each division, with checks handed out to every staff member along with a detailed calculation of the amount paid so that the staff could verify that the amount was indeed correct.

## Part II

## Online Appendix Tables

## A Additional Results

This section presents additional results on the supervisors treatment and perceived monitoring and effort as reported by inspectors.

Table 11: Impact of Interactions between Supervisory and Inspector Treatments on Revenue Outcomes

|  | Total | Current | Arrears |
| :--- | :---: | :---: | :---: |
| Supervisory treatment | -0.086 | $-0.131^{*}$ | -0.111 |
|  | $[0.146]$ | $[0.069]$ | $[0.500]$ |
| Inspector treatment | 0.063 | 0.068 | 0.034 |
|  | $[0.153]$ | $[0.151]$ | $[0.759]$ |
| Inspector Treatment * Supervisory Treatment | 0.100 | 0.076 | 0.271 |
|  | $[0.298]$ | $[0.446]$ | $[0.313]$ |
| N | 482 | 482 | 479 |
| Mean of control group | 15.901 | 15.662 | 14.157 |

Notes: This table checks for potential interaction effects between performance pay incentives for inspectors and supervisors. We use instrumental variables regressions, where both supervisory and circle treatments are instrumented with randomization results. The unit of observation is a circle, as defined at the time of randomization. Columns separate recovery by total recovery (Column 1), current year recovery (Column 2), and collections against past arrears (Column 3). Specification include division fixed effects and baseline log revenue collection. Mean of control group reflects mean for pure controls, i.e. circles that did not fall under either the inspector or supervisory treatments. The Information treatment is included in the controls. Randomization inference based p-values in brackets. * $\mathrm{p}<0.10,{ }^{* *} \mathrm{p}<0.05,^{* * *} \mathrm{p}<0.01$

Table 12: Impact of Treatment on Inspector Monitoring

|  | $(1)$ <br> Pressure from <br> supervisors | $(2)$ <br> Level of <br> monitoring |
| :--- | :---: | :---: |
| Panel A: Main Treatment | .0181 | -.0258 |
| Any treatment | $(.0302)$ | $(.0438)$ |
| Panel B: Subtreatments | .0163 | -.112 |
| Revenue | $(.0479)$ | $(.0706)$ |
|  | $-.0565^{*}$ | .0356 |
| Revenue Plus | $(.0296)$ | $(.0614)$ |
|  | $.0888^{*}$ | -.0161 |
| Flexible Bonus | $(.0519)$ | $(.0592)$ |
| N | 352 | 351 |
| Mean of control group | .104 | .775 |

Notes: This table examines the impact of performance pay on inspectors' perception of monitoring by supervisors. We use instrumental variables regressions, where treatment status is instrumented with randomization results. The unit of observation is a circle, as defined at the end of Year 2. Pressure from supervisors was assessed on a 5-point Likert scale. Level of monitoring was assessed on a 4 point scale. The Information treatment is included in the controls. Robust standard errors in parentheses. Standard errors are clustered by a robust partition of circles, i.e. the group of circles such that all circles that merged or split with each other are included within the same partition. ${ }^{*} \mathrm{p}<0.10,{ }^{* *} \mathrm{p}<0.05,{ }^{* * *} \mathrm{p}<0.01$

Table 13: Inspector Beliefs

|  | (1) | (2) | (3) | (4) |
| :---: | :---: | :---: | :---: | :---: |
|  | Chance of being rewarded after 2012 ballot | Chance of being selected in 2013 ballot | Chance of being selected in 2013 ballot relative to incentive circles | Chance of being selected in 2013 ballot relative to control circles |
| Information | $\begin{array}{r} .0222 \\ (.187) \end{array}$ | $\begin{aligned} & .0091 \\ & (.183) \end{aligned}$ | $\begin{gathered} .294 \\ (.213) \end{gathered}$ | $\begin{gathered} .429 \\ (.274) \end{gathered}$ |
| Revenue |  | $\begin{gathered} .163 \\ (.183) \end{gathered}$ |  |  |
| Revenue Plus |  | $\begin{gathered} .172 \\ (.176) \end{gathered}$ |  | $\begin{gathered} .112 \\ (.279) \end{gathered}$ |
| Flexible Bonus |  | $\begin{gathered} .266 \\ (.195) \end{gathered}$ |  | $\begin{gathered} .222 \\ (.253) \end{gathered}$ |
| N | 177 | 340 | 179 | 206 |
| Omitted group | Control | Control | Control | Revenue |
| Mean of omitted group | 4.00 | 3.98 | 2.12 | 2.00 |

Notes: This table examines how treatment assignment may have affected inspectors' subjective assessments of their chances of being selected for future schemes. We report ordered probit regressions, where treatment is measured with randomization results. The unit of observation is a circle, as defined at the time of randomization. Responses in columns 1 and 2 were coded on a 5 point probablity scale, with 1 indicating 'Not likely at all' and 5 indicating 'Definitely.' Responses in columns 3 and 4 were coded on a 3 point probability scale, with 1 indicating less chance, 2 indicating same chance, and 3 indicating higher chance. Robust standard errors in parentheses. Standard errors are clustered by a robust partition of circles, i.e. the group of circles such that all circles that merged or split with each other are included within the same partition. * $\mathrm{p}<0.10,^{* *} \mathrm{p}<0.05$, $^{* * *} \mathrm{p}<0.01$

Table 14: Spillovers

|  | $(1)$ | $(2)$ |  |
| :--- | :---: | :---: | :---: |
| Total | Current | $(3)$ <br> Arrears |  |
| Treatment | $0.105^{* * *}$ | $0.105^{* * *}$ | 0.126 |
|  | $(0.035)$ | $(0.037)$ | $(0.097)$ |
| Spillover Control | 0.021 | 0.027 | 0.027 |
|  | $(0.027)$ | $(0.026)$ | $(0.077)$ |
| N | 480 | 480 | 476 |

Notes: This table examines possible geographic spillover effects. We present instrumental variable regressions, with (own-circle) randomization results instrumenting for (own-circle) implementation. The unit of observations is a circle, as defined in FY 2013 Q4. The dependent variable is log recovery; columns seperate margins of collection. A spillover control circle is a control circle for which more than half of circles within 1 km are treatment circles. Treatment is own circle treatment status. Specifications control for baseline log recovery, and include stratum fixed effects. Information treatment is included in the controls. Standard errors are clustered by robust partition of circles, i.e. the group of circles such that all circles that merged or split with each other are included within the same partition. * $\mathrm{p}<0.10,{ }^{* *} \mathrm{p}<0.05,{ }^{* * *} \mathrm{p}<0.01$

## B Extensions to Main Tables and Robustness Checks

This section runs a series of data and specification robustness checks.

| Connected to Politician | 0.05 | 0.22 | 12,000 |
| Connected to Politician/Government/Police | 0.35 | 0.48 | 12,000 |
| Panel C: Inspector Survey Data |  |  |  |
| How would you score your circle team effort in your duties? | 90 | 14 | 370 |
| In a typical work day how many hours did you spend in the field | 5.40 | 0.92 | 370 |
| In a typical work day how many hours did you spend in the office | 2.70 | 0.96 | 370 |
| Total hours worked in a typical day (field + office) | 8.10 | 0.50 | 370 |
| Pressure from supervisors | 0.10 | 0.20 | 370 |
| Level of monitoring | 0.77 | 0.29 | 369 |

Notes: Panel A statistics from administrative data, shown for both the first year (FY 2012) and the second year (FY 2013) of the study. Each observation is one of the 482 circles as defined at the time of randomization. Panel B statistics from the property survey are for randomly sampled properties only. Subjective variables - i.e., Quality, Satisfaction, Degree of Corruption, Bribe Payment, and Frequency of Bribe Payment - are reported for circles from the first phase of the survey only (see text for more details). Panel C statistics from the inspector survey.

## E Dropping Revenue Plus Circles

While the Revenue Plus treatment was not unbalanced on any individual outcome variables, the balance tests in Table A. 1 suggested that one could reject balance for the joint test for the Revenue Plus treatment. Therefore these tables replicate our main results by excluding this treatment, to check whether average treatment effects are robust. We find that these results continue to hold.

## F Controlling for Variables from Balance Check

While the Revenue Plus treatment was not unbalanced on any individual outcome variables, the balance tests in Table A. 1 suggested that one could reject balance for the joint test for the Revenue Plus treatment. Therefore these tables replicate our main results by controlling for variables from the balance check, to check whether the estimates on the Revenue Plus treatment are robust. We find that these results continue to hold.

## G Dropping GPS Sampled Properties

Since there is a possible concern that the first point surveyed over-samples larger properties, in this section we replicate our main survey-result based tables excluding this first point. We see that the results are qualitatively unchanged.

Table 6-G: Selection Effects in Reassessment, Dropping GPS Sampled Properties

[^1]Table 7-G: Impacts on Bribes and Tax Payments, Dropping GPS Sampled Properties

## H Dropping Renters

There is a potential concern that rented properties may not have as much information about interactions with the tax department since ultimately the owner bears the responsibility for the tax bill. This section therefore shows our results on the subjective non-revenue outcomes are similar if we just include properties occupied by owners.

Table 4-H: Impacts on Non-Revenue Outcomes, Dropping Renters

Table 7-H: Impacts on Bribes and Tax Payments, Dropping Renters

## I Including Both Phases of the Survey

As explained in the paper, given the second phase of the survey occurred after the third (posttreatment) scheme had begun, there is a concern that the Phase 2 responses may not reflect treatment year behavior. Therefore in the main paper we only include data from Phase 1 for subjective survey outcomes. In this section we report results for both phases pooled and show this does not qualitatively affect our results.

Table I-4: Impacts on Non-Revenue Outcomes, Both Phases

[^0]:    ${ }^{51}$ To do this, we computed benchmarks for each quarter in the same manner as we computed annual benchmarks, and made payments based on the cumulative amount of revenue collected through that quarter compared to the analogously computed benchmark. Only half of cumulative earnings were paid out to mitigate the possibility that staff were overpaid in the event that the pace of collections slowed over the year. This process was clearly explained in advance to inspectors and formed part of the training.
